ABSTRACT

This study examines the effects of purchasing activities and the purchasing function's involvement with corporate strategy on manufacturing competitiveness as it is affected by national differences. In particular, we are interested in the research question: *Do purchasing theories built on samples from mainly North American and Western European countries apply in other countries with different cultural contexts?* The statistical results provide evidence that the engagement and efficacy of purchasing activities and strategic involvement within companies vary by national culture. A particular cultural dimension, Long-term orientation, is significantly related to the efficacy of purchasing activities and strategic involvement. This finding will enable top managers from different nations to adopt and implement purchasing activities with the realization of how those activities could lead to different outcomes.

Keywords: Purchasing, supply chain, national culture.

INTRODUCTION

Over the last two decades, the role of the purchasing function has been well recognized as a central component of the operations strategy of a company [9][28][33][39][44][49]. What is missing from the literature, however, is a thorough understanding of effects that national influence may have on purchasing activities and how this affects manufacturing performance. Despite cautions from many studies, the extant operations management (OM) literature often assumes that theories developed based on USA or European data are universal and, though with no empirical support, applicable to other countries [14][19][32][36][59]. From the perspectives of both research and industry practice, ignorance of national differences can be misleading. For instance, Hofstede [19] found that many applications of management theory have failed even with the most experienced international

companies due to cultural misunderstanding. In support of this, using Chinese samples, Zhao *et al.* [59] found that a manufacturing strategy theory developed using North American data may not be applicable to Chinese firms.

The effects of national differences on purchasing activities have been noted but not properly studied and/or validated [28][36][41][43]. Often, purchasing studies have examined the issue of national differences using very limited data that were collected from a single country or two countries for comparison [3][5][36]. Moreover, national difference is often treated as a control variable, while its explanatory influence on purchasing activities is not well understood. Yet it is vital that managers responsible for global operations understand how resident managers, based in different countries, make different decisions affecting purchasing activities [3][43]. The overarching objectives of this study are, therefore, to validate previous findings showing cultural differences in purchasing activities and to further the understanding of how national differences influence the efficacy of purchasing activities on manufacturing performance.

The particular research question we intend to address is whether purchasing theories, though well grounded in the literature, are, in fact, universal and applicable to countries with distinct cultures. Specifically, using data collected from 511 manufacturing plants, we investigate the relationship between purchasing activities (including the implementation of purchasing activities and strategic involvement of purchasing functions) and manufacturing competitiveness performance across two culturally distinct country groups, Western Europe/USA and Asia. The following section reviews relevant literature pertaining to several frequently cited purchasing activities and strategic purchasing involvement and their importance to manufacturing performance. Research hypotheses are developed, followed by the presentation of research methodology, including samples and measurements. The statistical results and discussion in relation to national differences are

presented. Finally, managerial implications and suggestions for future research are provided.

THEORETICAL DEVELOPMENT

Based on the purchasing literature (see [6][9][27][33][12][38]) and the suggestion from Dr. Phillip Carter, the Director for Advanced Purchasing Studies, at the Institute of Supply Management, this section selects and reviews several purchasing activities that are frequently discussed and implemented in the industry. This list of purchasing activities encompasses various practices related to procurement, supplier development and supplier involvement. For each purchasing activity, we review its impacts on various aspects of manufacturing performance, including cost, quality, delivery, and flexibility. We also review the effect of purchasing strategic involvement as suggested by previous studies [30][33][51].

Purchasing Activities (PA)

a. Buyer sponsored supplier conferences. Ellram and Edis [11] described buyer-sponsored supplier conferences as meetings with the firm's suppliers that cover such issues as expectations for the suppliers, as well as issues relating to the long-term supplier-buyer relationship. The involvement and importance of buyer and seller collaboration is evident in the literature. Several studies cited supplier conferences as a critical activity that enhances supplier and buyer collaboration and manufacturing performance [5][6][8].

b. Formal strategic sourcing process. Narasimhan and [33] and Talluri and Narasimhan [49] emphasized the importance of the strategic sourcing process that involves careful selection of suppliers, development of long-term relationships, and implementation of a continuous feedback system between buyer and supplier. The strategic sourcing process includes insourcing and outsourcing decisions, both of which contribute greatly to delivery performance [6][48][50].

c. Reverse auctions. Reverse auctions allow buyers to make purchases by observing a series of bids from sellers [13][47]. Supply chain partners around the world can get connected using web-based electronic reverse auctions. Carter *et al.* [6], Essig and Arnold [13] and Rhea [42] confirmed that e-procurement programs with e-reverse auctions could lower purchasing transaction costs, as well as increase opportunities for the purchasing function to produce value for the firm.

d. Supplier representatives in plant. McIvor and McHugh [31] identified supplier representatives in plants as assisting in two areas—purchasing and new product introduction. Suppliers could become members of cross-functional teams within the organization with their added benefit dependent on their level of participation and fellow team members' willingness to work with the supplier representative [33]. Womack and Jones [57] suggested that having supplier representatives housed in manufacturing facilities helps to quickly reduce response time associated with problems and mitigates negative effects. Specifically, with regard to new product development, utilizing supplier representatives reduces risks and resources, increases knowledge and its sharing, and reduces product-to-market time. Sara Lee Co. experienced a five-fold increase in process innovation with the use of in-plant supplier representatives who provided quicker and more accurate feedback on quality and innovation [1].

e. Strategic alliances/partnerships. A strategic alliance is a formal partnership between at least two firms that contributes to the strategic objectives of each firm (Pearson *et al.*, 1998). Strategic supplier alliances and partnerships can become competitive advantages through the development of long-term mutually beneficial relationships [8][24][33][54]. In general, a long-term strategic relationship would allow for informal communication that can expand the involved companies' knowledge of competitive issues through greater discovery and disclosure of information.

f. Commercial procurement software (e-procurement). Electronic procurement, often thought of as web-based procurement, includes web-based enterprise resource planning (ERP), e-sourcing, e-tendering, e-reverse auctioning, and e-informing [6][26][44]. Benefits of e-procurement include greater quantity and quality of information, thereby reducing uncertainty in purchasing activities, as well as faster processing in procurement activities [13].

g. Cross-functional commodity teams. According to Rozemeijer *et al.* [44], cross-functional commodity teams manage supply and purchasing requirements of many business units within a firm by utilizing collaboration from various functional units. Developing purchasing synergy is the primary goal of cross-functional teams. Ellram *et al.* [12] and Ellram and Edis [11] confirmed the contribution that purchasing teams make toward the overall cost performance of a firm. Sarin and McDermott [46] also showed that cross-functional teams allow for greater innovation and speed in decision making.

h. Early supplier involvement in design/redesign of products. Ellram *et al.*, [12] and Ellram and Edis [11] considered early supplier involvement an effective communication mechanism during the beginning stages of product development and procurement operations. They suggested that early supplier involvement is important for new product development. Primo and Amundson [44] also suggested there is a significant benefit to product quality from involving the vendor in new product development. Vendors who are intimately involved with companies in early design processes defining product requirements can significantly reduce cost and schedule performance issues by substantially reducing rework or total redesign of components involved with new designs. Kodak found many of these benefits in its early supplier involvement efforts with product design, as well as the benefits of reduced cycle time and quality problems [12].

i. Non-direct materials (MRO purchases) delegated to manufacturing/operations. Maintenance, repair, and operations (MRO) purchases are trending toward being outsourced, resulting in a reduced supplier base and potential cost savings [51]. In a survey distributed to 400 Fortune 500 purchasing groups, 42% responded that their companies had undergone significant changes in their MRO purchasing procedures, resulting in delegation of these procedures to the internal users of the goods/services [6][17].

j. Supply base rationalization (decrease/increase base). Determining the appropriate number of suppliers is the main foundation for supply base rationalization. The extant literature suggests that supply base rationalization enforces effective supplier selection, volume consolidation, and parts bundling, which in turn contribute to cost reduction and quality improvement, as is the case with Rover Motors [9][33][57].

k. Purchased items are classified as strategic or tactical and are purchased by separate teams. Tactical activities are considered to be of lower importance than other purchasing activities. These activities include several processes such as ordering, quoting, and expediting [6]. Tactical purchases are likely to be outsourced and/or automated over the next ten years, with many tactical purchases pushed into large contracts, thereby reducing the number of employees involved in these purchases [6]. In contrast, strategic purchases represent items of greater importance, with the procurement process focusing on supplier selection, and selection and development of cross-functional teams. Trent [52] asserted that separation between strategic and

tactical purchases improves procurement efficiency.

l. Formal supplier development program. Prahinski and Benton [39] defined formal supplier development programs as efforts by purchasing firms to measure and improve service and/or products received from supplying firms. Such programs can contribute to increased supplier and purchaser performance through enhanced communication and knowledge, which results in a significant positive improvement in buyer-supplier relationship [38]. They also discovered that supplier development activities are positively and significantly related to all aspects of manufacturing performance.

Purchasing Strategic Involvement (SI)

Strategic involvement, viewed as the integration of the purchasing function into corporate strategy, has been recognized for its strategic role [23][30][33][51]. Many have even argued that purchasing contributes significantly to corporate performance, and thus, supply chain management and should be a key component for consideration when developing a company's overall strategy. In support of this idea, Pearson *et al.* [37] discussed how overall firm performance is influenced by strategic supplier activities, especially in an international setting, pointing to additional reasoning in support of incorporating the purchasing function into corporate strategy. Lawson *et al.* [30] and Tan [51] found that companies are increasingly incorporating purchasing activities into corporate strategy, and he suggested that more research should be conducted on the specifics of integrating the purchasing function into corporate strategy.

Based on the above literature review defining important purchasing activities, a theoretical model is proposed in Figure 1. We posit that those purchasing activities and the strategic involvement of purchasing have positive impacts on manufacturing competitiveness measures of cost, quality, delivery, and flexibility. The following hypotheses are thus developed.

H1: Purchasing activities (PA) contribute to manufacturing competitiveness (MC)

H2: Purchasing strategic involvement (SI) contributes to manufacturing competitiveness (MC)

The research hypotheses are developed in order to test a purchasing model that, though well-grounded in the literature, has never been examined with a large international dataset. The remainder of this section discusses the need for

testing this model, taking into consideration national differences.

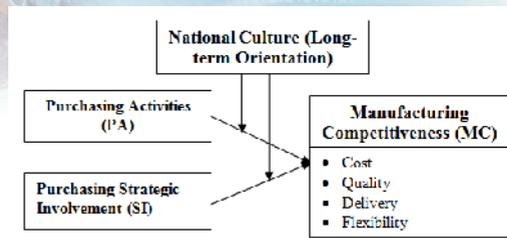

Figure 1. Theoretical model

National Culture Differences

Global Studies in various management fields have been performed analyzing cultural effects, such as supply chain effectiveness, project management, forecasting, and regulation compliance on supply performance. For instance, Wacker and Sprague [55] considered the role of national cultural differences and the underlying approach in forecasting. Pagell *et al.* [36] found that national cultural differences significantly influence international operations management behaviors among similar manufacturing plants in the same industry located in different cultures. Flynn and Sladin [14] examined whether or not the Baldrige criteria have relevance in countries with cultural differences. International projects raise additional issues and problems that have to be managed, such as legal/political issues, security, geography, economic status, infrastructure, and culture. Ruamshook *et al.* [45] suggested that, to maintain and improve a firm's future competitive advantage under conditions of heightening global competition, firms must develop and enhance management knowledge in order to optimize the strategic values of differing regions and nations of supply. Their findings indicated the existence of country or regional differences pertaining to supplier performance in the supply chain.

Several researchers have used national culture to illustrate and explain differences between countries. Hofstede [18] defined national culture as the collective mental programming of the people in a national context. Through an empirical study examining more than 10,000 managers in over 50 countries, he developed a quantitative classification scheme for measuring differences and similarities between national cultures. He then proposed that attitudes, beliefs, and behaviors could be categorized into five dimensions: individualism-collectivism, masculinity-femininity, power distance, uncertainty avoidance, and long-term orientation (Confucianism). In light of these five dimensions, Hofstede *et al.* [19] stated that people of a nation have "patterns of thinking, feeling, and acting that

differentiate one country from another and continue to be transferred from generation to generation." Table 1 provides definitions for the five dimensions and the respective indices for different regions. There seem to be significant cultural differences between Asian, USA, and Western European countries, especially regarding long-term orientation (LTO). Specifically, Asian countries receive an average score of 95, while both USA and Western Europe have average scores of 25.

Table 1. Hofstede's cultural dimension indices

Cultural Dimension	Asia	Europe	USA	World Average
Power Distance: the extent to which the less powerful members of organizations and institutions (like the family) accept and expect that power is distributed unequally.	60	40	38	52
Individualism: the relationship between the individual and the collective.	20	56	90	40
Masculinity: the extent to which gender affects the division of labor.	52	52	60	48
Uncertainty Avoidance: the extent to which countries deem the pursuit of certainty important.	60	70	42	51
Long Term Orientation (Confucianism): the extent to which one has a long- or short-term orientation, especially toward respect for tradition, fulfilling social obligations, and preserving one's face.	95	25	25	41

According to Hofstede *et al.* [19], Long-term orientation (LTO) (Confucianism) refers to the extent to which one has a long- or short-term orientation. Values associated with Long-term orientation are thrift and perseverance; values associated with Short-term orientation are respect for tradition, fulfilling social obligations, and protecting one's 'face'. LTO was previously discussed as an influential factor in purchasing activities. For instance, the strategic sourcing process involves planning and organizing long-term purchasing agreements with suppliers, as suggested by Cavinato *et al.* [7]. They argued that companies operating in cultures with higher future orientations would be more likely to utilize formal strategic sourcing processes. Moreover, Tucker [53] asserted that strategic supplier partnerships allow for sharing of information that can be vital for the success of both organizations involved, especially when crossing international borders. The development and planning involved in these alliances and partnerships could be supported by a country's future orientation. Barnes [2] suggested that supply base rationalization is supported by a future orientation, where organizations understand the ever-changing environment and make decisions to develop relationships and rationalize their supply base in an attempt to prepare for the future and secure success.

Overall, the extant literature has successfully demonstrated the effects national differences can have on various operations and supply chain decisions. Nonetheless, empirical support for the effect of national differences on purchasing activities is weak and is mostly from case studies or small-scale survey research, with only

two-country comparisons (see example, Carr *et al.*, [5]). The issue of national differences and purchasing activities has not yet been properly examined. This study intends to use a large-scale dataset, with samples from multiple countries to further understanding of this issue. In particular, this study adds to the literature by considering the role of national differences across ten countries involving 511 manufacturing plants. Based on the LTO scores, we combined three Asian countries (China, Korea, and Taiwan) into one group, while Australia, the USA, and several Western European countries (Austria, Germany, Italy, Switzerland, and Sweden) were combined into another group. Table 2 summarizes the issues of the two groups of countries. There is a glaring difference in LTO scores between the two groups. The average LTO score for the first group is 93.33, which is significantly higher than that of the second group, 33.29. We posited that national differences, from the long-term orientation standpoint, could potentially influence the choice and, thus, the efficacy of various purchasing activities and strategic involvement. Therefore, the following hypotheses are developed:

- H3: There are significant national culture differences in the relationships among purchasing activities (PA), strategic involvement (SI), and manufacturing competitiveness (MC)
- H3a. National culture differences affect the emphasis placed on purchasing activities (PA) and strategic involvement (SI)
- H3b. National culture differences affect the contribution of purchasing activities (PA) and strategic involvement (SI) to manufacturing competitiveness (MC)

Table 2. Long-term orientation (LTO) score

Group & Country	LTO score	Sample size (n)
Group #1: Asia	Avg = 93.33	Total = 210
• China	118	57
• Korea	75	103
• Taiwan	87	50
Group #2: W. Europe/USA	Avg = 33.29	Total = 301
• Australia	31	30
• Austria	31	16
• Germany	31	58
• Italy	34	51
• Sweden	33	31
• Switzerland	44	31
• USA	29	84

Total number of samples = 511

RESEARCH METHOD

Data

The data was a subsample of Round IV of the Global Manufacturing Research Group (GMRG) survey effort. The GMRG is a multinational community of researchers studying the improvement of manufacturing practices

worldwide (www.gmr.org), and consists of leading international academic researchers from over twenty countries who developed the GMRG database survey instrument for use around the world. This survey facilitates global comparison of the effectiveness of manufacturing practices [56]. Since 1985, the GMRG has completed four rounds of the worldwide survey, from the most recent of which we obtained our data. The questionnaires were translated and back-translated for all countries by several academics. This study used the 511 samples collected from ten countries to perform necessary analyses for testing the proposed research hypotheses and the purchasing model (Figure 1). More details of the samples can be found in Table 3.

Table 3. Sample demographics

Number of Plant Employees	Overall (n=511)	Asia (n=210)	W. Europe/USA (n=301)
<50	15.8%	8.3%	17.3%
50 - 100	23.2	25.7	22.4
101 - 500	40.9	40.4	42.1
>500	20.1	24.6	18.2
	100.0%	100.0%	100.0%
Industry			
Electric & Electronic equipment (SIC 35 & 36)	24.3%	59.6%	16.3%
Primary & fabricated metal (SIC 31 & 33)	27.7	10.3	28.3
Plastic (SIC 20)	17.4	8.1	15.9
Others (e.g. Textile, food, chemicals, etc.)	35.4	21.8	39.1
	100.0%	100.0%	100.0%

Measurement: constructs of interest

The purchasing activity (PA) scale addresses various activities in which purchasing personnel engage, including procurement, supplier involvement and development. For each purchasing activity, managers were asked to what extent the activity is implemented (on a scale of 1-7 with 1 being “not used” and 7 being “a great extent”). All the activities are selected from the following literature: Carter *et al.* [6], Krause *et al.* [27], Narasimhan and Das [33], Ellram *et al.* [12] and Petersen *et al.* [37]. Overall, a high score on this scale indicates the purchasing function is effectively engaged in a large number of these purchasing practices, while a low score indicates a lower level of effectiveness or involvement. The scale for strategic involvement (SI) was adopted from Rozemeijer *et al.* [44] and Lawson *et al.* [30]. It measures the levels at which the purchasing function participates in forming strategic plans and receiving support from top management. A low score suggests a low degree of strategic involvement from the purchasing function.

The scales for manufacturing competitiveness (MC) have respondents rate their competitiveness as compared to their major industry competitors [25][29]. We captured the four main dimensions of manufacturing competitiveness: cost, quality, flexibility, and delivery. The scale was created and verified by previous GMRG studies [36][58].

Psychometric Properties

In this study, we used multiple items to present three latent constructs, Purchasing Activity (PA), Strategic Involvement (SI), and Manufacturing Competitiveness (MC). Each latent construct was tested for internal consistency using Cronbach's alpha and construct reliability. Alpha coefficients were between 0.73 and 0.89, which are above the benchmark of 0.70 suggested by Nunnally [34], and construct reliabilities were between 0.74 and 0.87, which are above 0.60. Overall, the results suggest high internal consistency of measurement indicators and, hence, reliability of each construct is ensured.

Next, convergent validity and discriminant validity were assessed. O'Leary-Kelly and Vokurka [35] suggested that the use of CFA to assess convergent and discriminant validity is more powerful and requires fewer assumptions than the traditional MTMM (multi-trait multi-method) matrix method. In the CFA model, each item was linked to its corresponding construct and the covariances among those constructs were freely estimated. The resulting model fit indices are $\chi^2(237) = 529.916$, IFI = .944, NFI = .904, CFI = .944, RMSEA = .049, which were better than the threshold values recommended by Hu and Bentler [22]. Moreover, all of the factor loadings are greater than 0.60 and the *t*-values are significantly greater than 2.0. In summary, the convergence of items on the factors they are intended to measure with significant positive loadings and a good overall model fit demonstrate the convergent validity and unidimensionality of these scales [16].

Discriminant validity is tested by comparing the correlation coefficients between latent constructs with the variance-extracted percentages for each construct [15]. The results indicate the variance-extracted percentages for constructs were higher than the correlation coefficients between latent constructs. The variance inflation factors (VIF) of all latent constructs were below the recommended value of ten, implying the lack of multicollinearity, thus discriminant validity is supported.

STATISTICAL ANALYSIS

For the purposes of this study, two statistical methods were applied. First, multiple-group structural equation modeling (SEM) analysis was performed to test the postulated research hypotheses and the model in Figure 1. Next, we applied regression analysis to examine whether the two country groups differ in their choice and efficacy of purchasing activities and strategic involvement.

SEM Analysis

A series of multi-group SEM analyses were performed, using LISREL 8.70, to examine whether different groups (Group 1: Asia; Group 2: Western Europe/USA) have different path coefficients of the structural model [16]. We also performed another analysis treating Asia, USA and Western Europe as three separate groups. Table 4 summarizes the SEM results; including model fit indices, standardized path coefficients, and significance levels. The results for both SEM analyses, two groups (Asia vs. Western Europe/USA) and three groups (Asia vs. Western Europe vs. USA), are similar. Our discussion is based on the findings from the two-group analysis as presented in Table 4a.

First, for the All-sample group, the fit indices were all found to be within an acceptable range (CFI = .96, NFI = .94, RMSEA = .050), suggesting a good fit between the model-implied covariance matrix and the data. All causal paths are statistically significant at the 0.05 level, supporting H1 and H2. In other words, both purchasing activities and strategic involvement improve all four aspects of manufacturing competitiveness where the impacts on delivery ($\beta = 4.30^*$; $\beta = 4.47^*$) and flexibility ($\beta = 4.09^*$; $\beta = 4.43^*$) are higher than on cost ($\beta = 1.77^*$; $\beta = 2.04^*$) and quality ($\beta = 2.04^*$; $\beta = 2.24^*$).

Table 4. SEM results

(a) Multi-group SEM: Two groups

Structural path	Path coefficients (Standardized)			$\Delta\chi^2(df=1)$
	All sample	Group #1: Asia (n=210)	Group #2: W. Europe/USA (n=301)	
PA → Cost	1.77*	1.04	1.56**	42.52**
PA → Quality	2.04*	1.62	1.72**	21.62*
PA → Delivery	4.30*	3.49**	3.34**	0.36
PA → Flexibility	4.09*	3.36**	3.42**	0.33
SI → Cost	2.04*	1.64**	1.09*	10.16**
SI → Quality	2.24*	1.81*	1.72*	1.71
SI → Delivery	4.47*	3.69**	3.65**	0.74
SI → Flexibility	4.43*	3.67**	3.62**	0.53

$\chi^2 = 528.58$; RMSEA = 0.050; NFI = 0.94; CFI = 0.96; RMR = 0.050; GFI = 0.92

(b) Multi-group SEM: Three Groups

Structural path	All sample	Path coefficients (Standardized)			$\Delta\chi^2(df=2)$
		Group #1: Asia (n=210)	Group #2: W. Europe (n=217)	Group #3: USA (n=84)	
PA → Cost	1.77*	1.70	2.18*	2.19*	27.66**
PA → Quality	2.04*	1.48	2.41*	2.64*	23.31*
PA → Delivery	4.30*	3.05*	3.13*	3.09*	0.76
PA → Flexibility	4.09*	3.88*	3.96*	3.91*	0.83
SI → Cost	2.04*	2.23**	1.51*	1.50*	14.02**
SI → Quality	2.24*	2.32*	2.19*	2.21*	1.71
SI → Delivery	4.47*	5.08*	5.01*	5.10*	-0.06
SI → Flexibility	4.43*	5.09*	5.01*	5.09*	0.0

$\chi^2 = 528.58$; RMSEA = 0.050; NFI = 0.94; CFI = 0.96; RMR = 0.050; GFI = 0.92

* $p < 0.05$, ** $p < 0.01$

The results also suggest the moderating effects of national culture on the causal model since two groups display different path coefficients of the structure model. As shown in Table 5a, three causal paths are moderated by the variable of culture (*i.e.*, PA → Cost, PA → Quality; SI → Cost). According to the estimated path coefficients, the impact of purchasing activities on

cost and quality for the Asia group is significantly different from that of the Western Europe/USA group ($r^2 = 42.52^{**}$ (Cost); $r^2 = 21.62^*$ (Quality)). Meanwhile, the effect of SI on Cost is also significantly different between the two groups ($r^2 = 50.56^*$). The results suggest that the strategy of improving cost and quality performance by performing purchasing activities works effectively for the Western Europe and USA group but not so for the Asia group. On the other hand, the Asian samples appear to benefit more from purchasing strategic involvement than the Western Europe/USA samples regarding cost performance ($r = 1.64^*$ vs. $r = 1.09^*$).

For the second SEM analysis (Asia vs. Western Europe vs. USA), similar results are found (Table 4b). Namely, the impact of purchasing activities on cost and quality for Group #1 are significantly different from Groups #2 and #3. In the meantime, the path coefficients for the USA group and the Western Europe group are not significantly different. While more studies must be performed to generalize the findings, our results raise a valid proposition that purchasing activities and strategic involvement adopted by different culture groups have potentially different impacts on manufacturing competitiveness, especially with regards to cost performance. Our findings in Table 4 suggest that Long-term orientation is a more plausible indicator than geographical location to define country groups and predict the effects of purchasing activities and strategic involvement.

In summary, the SEM results suggest that the relationships among purchasing activities, strategic involvement, and manufacturing competitiveness are not always consistent between the two country groups. Therefore, H3 is supported. Purchasing activity and strategic involvement in the Asia group do not seem to contribute to manufacturing competitiveness in the same manner as is seen in the Western Europe/USA group. In order to gain a deeper understanding of the emphasis and efficacy of particular purchasing activities, we decided to perform further analyses at the individual purchasing activities level.

Regression Analysis

Table 5 displays the descriptive statistics for purchasing activities, strategic involvement, and competitive goal performance. In general, with a few exceptions, countries in Asia receive higher ratings for their efforts in implementing purchasing activities and purchasing strategic involvement. Meanwhile, no statistically significant difference between Asia and Western Europe/USA is found regarding the four aspects

of competitiveness.

Four regression analyses were performed next to examine the effects of individual purchasing activities and strategic involvement on four competitiveness goals. The results of the regression analyses (Table 6) reveal that many purchasing activities contribute to firm performance, but not all activities in both groups similarly or significantly contribute to all four competitiveness goals. More importantly, the contribution of individual purchasing activities and strategic involvement varies between Asia and Western Europe/USA. While strategic involvement influences cost performance in the Asian group, this factor appears to be more influential in Group #2 on quality, delivery and flexibility performance. For the Asia group, only five out of ten purchasing activities contribute to competitiveness. In contrast, for the Western Europe/USA group, eight out of ten activities have significant effects on manufacturing competitiveness. Only four particular activities (reverse auction, cross-functional team, supply base rationalization, and formal supplier development) are beneficial to both groups. Each country group has a different bundle of purchasing activities that it could implement to enhance performance.

Table 5. Regression analysis (1)

Item	Group #1 (Asia) (n=210)	Group #2 (W. Europe/USA) (n=301)	Group mean difference
• Purchasing strategic involvement	4.80	4.63	*
• Buyer sponsored supplier conferences	4.08	4.04	—
• Formal strategic sourcing process	4.70	3.59	**
• Reverse auctions	3.24	3.97	**
• Commercial procurement software	3.83	2.39	**
• Cross-functional commodity teams	4.99	2.76	**
• Early supplier involvement in design	4.17	4.67	**
• Non-direct materials	4.16	3.01	**
• Supply base rationalization	4.23	3.60	**
• Items classified as strategic or tactical	3.89	3.95	—
• Formal supplier development program	4.25	2.78	**
• Cost	4.66	4.31	
• Quality	3.46	3.51	—
• Delivery	3.07	3.21	
• Flexibility	3.11	4.96	—

Overall, the results in Tables 5 and 6 indicate that the emphasis and efficacy of purchasing activities and strategic involvement between these two groups are substantially different, thus supporting H3a and H3b at the item level.

DISCUSSION

Efficacy of PA and SI

Since most purchasing and supply chain management theories were developed based on western culture and data, it is important to verify whether those theories are universal [20][21][36]. Our statistical findings suggest that there are differences between the two country groups regarding their emphasis and efficacy of purchasing activities and strategic involvement. The SEM results reveal that the proposed purchasing model, which is well grounded from the purchasing literature, does not receive the same support from the Asian samples despite being verified by the Western Europe/USA data. Three out of eight causal paths were found to be significantly different between the two country groups (Table 4). Several Operations Management (OM) studies previously cautioned about the application of theories developed in North American and European countries to other parts of the world [36][59]. This study validates and reinforces that message.

Another interesting observation from the SEM results is that the strength of path coefficients associated with purchasing activities appears to be consistently weaker in Group #1 (Table 4a, b). On the other hand, the influences of strategic involvement are consistently stronger in Group #1. This finding implies that purchasing activities and strategic involvement in Asian countries do not have the profound contribution to manufacturing competitiveness as is seen in Group #2. In other words, Asian firms, with a relatively high long-term orientation, perceive themselves as being more intensively engaged in purchasing activities, but they are not as effective as their Western Europe/USA counterparts regarding the implementation (Tables 5 and 6). Ruamshook *et al.* (2007) also observed that European countries and the USA have better supply chain management than some of their counterparts in Asia. Clearly, the question appealing to managers is why differences occur, and there may be several possible explanations for differential effectiveness of purchasing activities between the two country groups. For instance, it is likely that the plants in the USA and Western Europe have more advanced IT or more expertise to perform some of those purchasing activities [5].

It is also possible to attribute the differential

effectiveness to the use of Hofstede's culture scale. According to another renowned national culture research project, the GLOBE (Global Leadership and Organizational Behavior Effectiveness) study, cultural dimensions should be assessed from two perspectives, "as is" and "should be" [21]. The first perspective indicates where managers believe their country *currently is* and the latter represent where they believe their country *ideally should be*. Therefore, it is likely that Hofstede's LTO score captures the "should be" aspect but not the "as is." Based on the GLOBE project, the countries in Group #1 (Asia) generally have higher "should be" scores than those in Group #2 (Western Europe/USA), a finding consistent with the information from Hofstede's LTO scores. Meanwhile, Group #1 has lower "as is" scores than Group #2. Specifically, the average "as is" score for Group #1 is 3.89, as opposed to 4.15 for Group #2. That means, in practice, that the countries in Group #2 are actually managing their purchasing function more in tune with the long-term perspective (as is), while Group #1 may desire to be more that way (should be) but fail to. In other words, the mere fact that an Asian firm claims to engage in purchasing activities does *not* mean that those purchasing activities will be well implemented or deliver competitive advantage. It is beyond the scope of this study to investigate and compare Hofstede's and GLOBE's culture scales, but our findings definitely suggest an interesting future research topic.

Engagement of PA and SI

In addition to different path coefficients found from the SEM models, our results reveal that sample plants from Asia perceive that their engagement in purchasing activities and strategic involvement was more intensive and more aligned with competitive strategy (Table 5). As discussed earlier in the literature review [7][53], at least three purchasing activities have particular long-term implications on manufacturing operations and are likely to be emphasized by countries with high LTO scores. Those three particular activities and the associated LTO scores for both groups are "Formal strategic sourcing process" (4.70 vs. 3.59), "Supply base rationalization" (4.53 vs. 3.60), and "Formal supplier development program" (4.25 vs. 2.78). We decided to examine how much of the difference between the two groups of countries can be accounted for by the cultural dimension Long-term orientation. To do so, we used hierarchical regression with industry and employment entered as controls in the first step and LTO scores entered in the second step. Hierarchical regression was chosen since it provides a clear picture of additional explanatory power created by adding elements of culture to a

base model.

Table 7 summarizes the results of hierarchical regression for the three selected purchasing activities: “Formal strategic sourcing process”, “Supply base rationalization”, and “Formal supplier development program”. For all analyses, we consistently obtain increased adjusted R-squared values after adding the cultural dimension LTO to the control model consisting of only plant size and industry. For “Formal supplier development”, the adjusted R² is .046 with size and industry included in the model, and the addition of LTO score increasing the figure to .201, or an increase of .155. For the other two activities, the adjusted R² increases from .029 and .023 to .095 and .087, respectively. It appears that LTO offers significant explanatory power to the choice and engagement of purchasing activities. Again, these three particular purchasing activities are examined since there is support in the literature for their connection to long-term orientation. Future research should review and verify the effects of culture on other activities.

Table 7. Hierarchical regression

Step	Selected Purchasing Activities					
	Formal strategic sourcing		Supply base rationalization		Formal supplier development	
	Model variables	t value (Sig.) Adjusted R ²	Model variables	t value (Sig.) Adjusted R ²	Model variables	t value (Sig.) Adjusted R ²
1	Size Industry	3.639 (.000) -1.668 (.064) Adj. R ² = .029	Size Industry	3.113 (.001) -1.223 (.186) Adj. R ² = .023	Size Industry	4.738 (.000) -1.857 (.034) Adj. R ² = .046
2	Size Industry LTO	2.319 (.018) -1.712 (.077) 5.110 (.000) Adj. R ² = .095	Size Industry LTO	2.163 (.031) -1.160 (.258) 5.078 (.000) Adj. R ² = .087	Size Industry LTO	2.825 (.005) -1.110 (.241) 9.183 (.000) Adj. R ² = .201

Independent variables: Size, industry, LTO

In summary, our findings from both SEM (Table 4) and regression analysis (Tables 5, 6, and 7) offer strong supports for our research proposition that national culture could affect purchasing activities. National differences or national culture are often treated as control variables in OM literature (e.g., [36]). We are working under the belief that while controlling for culture is better than ignoring it, doing so may still conceal important differences across cultures. Results based on using culture as a control variable may give a false sense of the universality of a theory and/or result. Our findings indicate the significant explanatory power of national culture, validating the need for using national culture to study national differences regarding purchasing and supply chain management decisions.

CONCLUSIONS

Having an understanding of the international cultures involved in purchasing activities is vital to successful operations, but many purchasing managers do not have the necessary understanding of national differences [3][43]. In the past, OM literature often treated national culture as a control variable [36], ignoring the

possibility of using culture as a variable to explain and predict differences in purchasing activities across nations. Responding to the call for better understanding of national differences, this study aims at addressing the research question: *Do purchasing theories built on samples from mainly Western companies apply in other cultural contexts?* Based on the data collected from ten countries or two distinct cultural groups, we tested a purchasing model that is well-grounded in the literature. Our results suggest that the intensity and efficacy of purchasing activities and strategic involvement vary between the two country groups, Asia and Western Europe/USA. The Western Europe/USA samples adequately fit the purchasing model in Figure 1, but the Asian samples do not. At the item level, we find a common set of purchasing activities contributing to manufacturing competitiveness regardless of national differences. Yet we also find substantial evidence of culturally specific selections of activities. Manufacturing competitiveness is achieved by implementing different bundles of purchasing activities adopted by manufacturing plants from different cultures. In short, the findings suggest that national differences matter in implementing purchasing activities. Previously built purchasing theories and models may not be universal and more studies must be done to examine their applicability. While globalization becomes more widespread, the differences between national cultures must be part of research and theory development regarding supply chains.

This study represents a first attempt at using national culture to explain differences in purchasing activities and strategic involvement. To successfully manage an international supply chain, it takes more than knowing that purchasing activities are implemented differently in different countries. While our results clearly suggest the influence of a particular cultural dimension, Long-term orientation, companies must realize what makes purchasing management different in various countries. Specifically, future studies should continue to investigate what dimensions of national culture influence operations decisions and to what extent as well as how that influence occurs. In particular, OM research needs to move beyond macro-level theory that focuses on whether culture matters to the more micro-level question focusing on how culture matters. Such an understanding will better prepare multi-national companies to more effectively manage the global supply chain.

Finally, this study adopted Hofstede’s culture scale to examine the effects of national culture on purchasing activities and decisions. We were able to connect long-term orientation scores with the emphasis firms in different countries place on

their purchasing activities and strategic involvement. Nonetheless, Hofstede's culture score failed to predict the efficacy of purchasing activities and strategic involvement. Future OM research should examine and compare alternative culture scales (e.g., the GLOBE study) regarding their pros and cons for assessing various aspects of purchasing and supply chain decisions. A reliable scale that could accurately capture various cultural dimensions would be beneficial to multinational firms.
